Claim Set as Amended

1-10. (Cancelled)

11. (Previously Presented) A disk transferring device for a disk drive, comprising:

a moving unit for being contacted to one surface of a disk and rotated by the force of a driving source for thereby moving the disk;

a balance guide unit for guiding the disk for thereby precisely inserting the disk;

a holder guide unit which is connected with the balance guide unit and is operated by operation of the balance guide unit for guiding the disk moved by the moving unit and guiding the disk until the disk transfer is finished;

a selection guide unit which is connected with the holder guide unit for positioning the disk according to the size of the disk; and

a clamping driving unit for clamping the disk, the clamping driving unit being interlocked with the selection guide unit.

12. (Previously Presented) The device of claim 11, wherein the holder guide unit or selection guide unit receives the driving force separated from the disk from the driving source when the disk transfer is finished.

13. (Previously Presented) The device of claim 12, wherein the holder guide unit interlocks with the clamping driving unit for thereby being separated from the disk.

14. (Previously Presented) The device of claim 12, wherein the selection guide unit interlocks with the clamping driving unit for thereby being separated from the disk.

15-17. (Cancelled)

18. (Previously Presented) The device of claim 11, wherein the disk transferring device further comprises a chassis, and a guide slot having a partial insertion preventing unit is formed at the chassis, a balance guide unit is installed at both ends of a disk insertion opening of the chassis, a guide rod contacting the perimeter portion of the disk during disk insertion is installed at one end of the balance guide unit, and a connecting pin inserted into the guide slot to be guided thereby is installed at the other end thereof.

19. (Previously Presented) The device of claim 11, wherein the power of the driving source is transmitted through a main power transmission system having a plurality of gears for transmitting the driving force of the driving source;

a disk transferring power transmission system having a plurality of gears receives the driving force from the main power transmission system and converts the same to the transferring of the disk; and

a clamping power transmission system selectively receives the driving force from the main power transmission system and converts the same to the clamping driving of the disk.

20. (Previously Presented) The device of claim 19, wherein the clamping power transmission system includes a driving plate for receiving power and transmitting the power to the lifting plate, the driving plate has a rack gear portion formed thereon, and a first gear tooth of the rack gear portion is formed to be rounded for thereby preventing collision with the opposite gear tooth engaged with the first gear tooth.

21. (Previously Presented) The device of claim 20, wherein, at the driving plate, a selection slot is formed for selectively guiding the selection guide unit according to the type of disk used.

22. (Previously Presented) A disk transferring device for a disk drive, comprising:

a first guide component to guide a disk being inserted into or removed from an opening of the disk drive; and

a second guide component operatively connected with the first guide element to guide the disk into and from an inner portion of the disk drive,

wherein the first guide component comprises:

a pair of guide arms that remain at a first position when guiding edge portions of a disk having a first size, and that move to a second position when guiding edge portions of a disk having a second size; and

a transfer device that cooperates with the pair of guide arms to operatively contact with a surface of and transfer the disk inserted into and removed from the disk drive.

23. (Previously Presented) The device of claim 22, wherein the second guide component remains at a first position when guiding the disk having a first size, and moves to a second position when guiding the disk having a second size.

24. (Previously Presented) The device of claim 22, further comprising:

a selection guide component connected with the second guide component to position the disk at the inner portion of the disk drive; and

a clamping drive component operatively connected with the selection guide component to clamp the disk positioned at the inner portion of the disk drive.

25. (New) A disk transferring device for a disk drive, comprising:

a moving unit for being contacted to one surface of a disk and rotated by the force of a driving source for thereby moving the disk;

a balance guide unit for guiding the disk for thereby precisely inserting the disk;

a holder guide unit which is connected with the balance guide unit and is operated by operation of the balance guide unit for guiding the disk moved by the moving unit and guiding the disk until the disk transfer is finished;

a selection guide unit which is directly connected with the holder guide unit for positioning the disk according to the size of the disk; and

a clamping driving unit for clamping the disk, the clamping driving unit being interlocked with the selection guide unit.

26. (New) A disk transferring device for a disk drive, comprising:

a moving unit for being contacted to one surface of a disk and rotated by the force of a driving source for thereby moving the disk;

a balance guide unit for guiding the disk for thereby precisely inserting the disk;

a holder guide unit having a rod for guiding a side of the disk and which is connected with the balance guide unit and is operated by operation of the

balance guide unit for guiding the disk moved by the moving unit and guiding the disk until the disk transfer is finished;

a selection guide unit which is connected with the holder guide unit for positioning the disk according to the size of the disk; and

a clamping driving unit for clamping the disk, the clamping driving unit being interlocked with the selection guide unit.
